The present sequence is the cDNA encoding human ELK (hElk) polypeptide monomer, comprising an alpha subunit of the voltage-gated potassium channel (vGPC6). It is a member of the Kv (Voltage gated potassium) enperfamily, Eag (ether a go-go) family and Elk subfamily of potassium) channel monomers. HElk gene is mapped to chromosome 12413. It is isolated from brain and maintains the resting potential and controls excitability of the cell. It has antimigrane, cereboppotective, antipsychotic, neuroprotective and anticonvulsant activity. The HELK polypeptide can be used to screen for modulators of VGPCs, that are useful for treating abnormal ion flux disorders, CNS disorders such as migraines, hearing and vision problems, seizures, psychotic disorders and to prevent strokes. It can be used as a marker for disagnosis of diseases linked to this gene and also as reporter modecule in detection systems. The polynucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

```
The present sequence encodes a human potassium channel protein of the ERG family, which is designated Herg4 (human erg related gene 4). The Herg4 polypeptides and polymucleotides are useful in the treatment of epilepsy, migraine, cell proliferation disorders, cancer, comportemental troubles, hormones. Autibodies against Herg4 are also useful for the treatment of cerebral, cardiac and renal isochemias, brain and cardiac diseases, inflammation, pain, and to mimic or antagonize the effect of endogenous
                                                                                                                                                                                                                                     Novel herg4 polypeptide of human erg potassium channel family treatment of epilepsy, migraine, cell proliferation.

4;

DNA encoding a herg4, potassium channel protein of the ERG family.

(first entry)

08-AUG-2000

AAA14893

BP.

AAA14893 standard; DNA; 3252

RESULT

Human; potassium channel protein; Herg4; human erg related gepilepsy; migraine; cell proliferation disorder; cancer; comportemental trouble; neurotransmitter; hormone; ischemia; brain disease; cardiac disease; inflammation; pain; ss.

This sequence represents human potassium channel K+Hnov14 CDNA. K+Hnov CC proteins have a high degree of homology to known potassium channels and may be alpha subunites, which form the functional channel, or accessory cubunits that act to modulate the channel activity. K+Hnov14 is a framemebrane domain, voltage gated potassium channel. The gene's chromosomal location is 12q14, determined via PCR chromosomal coation of expressed sequence tags (BSTS) which were isolated by extension of expressed sequence tags (BSTS) which were clasted but not identical to known human potassium channels. Potential polymorphisms detected as sequence variants between multiple independent clones. Potassium channels have critical roles in various cell types and biochemical pathways. Defective potassium channels are known to cause four human diseases: episodic ataxia with myokymia; cardiac arrhythmia clong OT syndrome); episepsy; and Bartter's syndrome. As potassium channels are critical components of virtually all cells, it is likely that anormal potassium channels are also implicated in certain renal, cardiovascular and central nervous system (CNS) disorders. Nucleotides encoding K+Hnov proteins may be used for identifying homologous or clated protesin and in studying the biochemical pathways associated with the They may also be used for the recombinant production of K+Hnov protein and in studying the biochemical pathways associated with content the procession confides may be used for the recombinant production of K+Hnov protein and in studying the biochemical pathways associated with content the parameter of the recombinant production of files were the protein and in studying the biochemical pathways associated with the parameter of the recombinant production of filespace of the recombinant production of filespace of the recombinant production of filespace of the recombinant production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CCGTGGTCTACTGCTCTGATGGCTTCTGTGACCTCACGGGCTTCTCCCGGGCTGAGGTC 425

                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a cDNA encoding ERG-like protein 1 (ERG-LP1) which is a member of ERG potassium channel family. This sequence is from a full length clone jikba25d10 which was derived from monkey hippocampal library. ERG-LP1 is expressed exclusively in the brain. Highest expression is found in cortical regions, hippocampus, caudate and amygdalar. The protein functions as a potassium channel modulator and has neuroprotective, antiParkinsonian, anticonvulsant, antidepressant, treating several potassium channel mediated disorders (CNS disorders) such as Alzheimer's disease, Parkinson's disease, multiple sclerosis, epilepsy, depression, schizophrenic disorders and amnesia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 ATGCCGGCCATGCGGGCCTCCTGGCGCCTCAGAACACCTTCCTGGACACCATCGCTACG

The invention relates to an isolated human ERG-like protein (ERG-LP2) of the ERG potassium channel family and the nucleic acid encoding it. The ERG-PP2 polypeptide or nucleic acid is useful for medulating potassium channel mediated activity in a cell, such as a neuronal cell or a muscle cell. The ERG-LP2 polypeptide or nucleic acid is particularly useful for treating potassium channel associated disorders, e.g. neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, multiple classis, amyotrophic lateral sclerosis, supranuclear palsy, epilepsy or creutzfeldt-Jabob disease), psychiatric disorders (e.g. depression, schizophrenia, Korsakoff's psychosis, mania, anxiety or phobias), contactificated-Jabob disease), psychosis, mania, anxiety or phobias), cobssity, cardiac disorders (e.g. atteriosclerosis, ischaemic reperfusion injury, restenosis, conqestive heart failure, angina, hypertension, coronary artery disease or arrhythmia), coronary actery disease or arrhythmia), cardial infarction, coronary attery disease or arrhythmia), cardial disorders (e.g. atresia, hiatal hernia, peptic ulcers, gastritis, stomach tumours, Crohn's disease or ischaemic bowel disease) or pain (e.g. joint pain, tooth pain or headaches). The present invention relates to novel ERG potassium channel like proteins, designated ERG-LPS, and the polynucleotide sequences encoding them. Also disclosed are: a host cell contraining the polynucleotide, an antibody that selectively binds to the polypeptide, a method for producing the polypeptide, a method for detecting the presence of the polypeptide or the nucleic acid in a sample, a method for identifying a compound that binds to the polypeptide, a method for medulating the activity of the polypeptide, and a kit. The polynucleotide sequences are useful for producing the ERG-LP polypeptides. The ERG-LP polynucleotide and polypeptide sequences are useful for treating a compound that composition for diagnosing or treating diseases e.g. tumours. The present sequence encodes monkey ERG-LP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CGGAAGAGCGGCTCCCGTTCTGGTGTCTCCTGGATGTGATACCCCATAAAGAATGAGAAA 360

```
The invention relates to an isolated human BRG-like protein (BRG-LP2) of the ERG potassium channel family and the nucleic acid encoding it. The ERG-LP2 polypeptide or nucleic acid is useful for modulating potassium channel mediated activity in a cell, such as a neuronal cell or a muscle cell. The ERG-LP2 polypeptide or nucleic acid is particularly useful for treating potassium channel associated disorders, e.g. neurodegenerative cisorders (e.g. Alzheimer's disease, Parkinson's disease, multiple cisorders (e.g. Alzheimer's disorders (e.g. depression, creutzfeldt-Jakob disease), psychiatric disorders (e.g. depression, creutzfeldt-Jakob disease), psychhatric disorders (e.g. depression, charing or memory disorders (e.g. amnesia or age-related memory loss), cobesity, cardiac disorders (e.g. atteriosclerosis, ischaemic reperfusion injury, restenosis, congestive heart failure, angina, hypertension, coronary artery disease or arrhythmia), corpustion, coronary artery disease or arrhythmia), gastrointestinal disorders (e.g. atresia, hiatal hernia, peptic ulcers, gastritis, stomach tumours, Crohn's disease or ischaemic bowel disease) cor pain (e.g. joint pain, tooth pain or headaches). This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                 New human ERG-like protein (ERG-LP2) potassium channel polypeptide and nucleic acid, useful for treating or diagnosing e.g. Alzheimer's disease, schizophrenia, obesity, restenosis, myocardial infarction, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

This sequence encodes a rat potassium channel protein, and was used as a probe to isolate DNA encoding the protein of the invention. The protein of the invention is a human brain specific potassium channel protein. The

Potassium channel protein expressed specifically in brain tissue and method for its production.

WPI; 1999-458683/38.

```

The present invention relates to a method for predicting a toxic effect of a compound. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the center of a tissue or cell sample exposed to the compound, and comparing the differential expression of the gene indicates at least one toxic effect. The method is useful for predicting at least one toxic effect of a compound, predicting hepatotoxicity or the progression of a toxic effect. The compound, identifying an agent that modulates the onset or compound modulates in a cell, and identifying an agent that modulates at least one activity of a profein. The method and compositions of the compound modulates in a cell, and identifying an agent that modulates at least one activity of a profein. The method and compositions of the present invention using a database of genes having liver toxin-induced differential expression, are useful in identifying toxicity markers in liver tissues or cells for drug screening and toxicity assays. Note: The sequence data for this patent did not form part of the printed of the union in the printed of the composition of the printed of the union in the profession of the printed ftp.wipo.int/pub/published_pct_sequences.

The protein is used to treat and investigate disorders of the central nervous system such as dementia and cerebral ischaemic solerosis

This sequence encodes a rat potassium channel protein, and was used as a probe to isolate DNA encoding the protein of the invention. The protein of the invention is a human brain specific potassium channel protein. The protein is used to treat and investigate disorders of the central nervous system such as dementia and cerebral ischaemic sclerosis
                                                                                              Potassium channel protein expressed specifically in brain tissue and method for its production.
                                                                                                                                 Example 3; Page 57-59; 63pp; English

Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox mean values.

Claim 44; SEQ ID NO 4023; 874pp; English

The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly heparcotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This is the 5' sequence of the clone insert
clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKPZ); Email s.wiemannadkfz- heidelberg.de;
sequenced by DKFZ (German Cancer Research Center,
Heidelberg/Germany) within the cDNA sequencing consortium of the
German Genome Project.
No 81 sequence available.
No 81 sequence available.
Phis clone (DKFSD54712290) is available at the RZPD in Berlin.

/ note="Organ: Brain; Vector: pXx- Asc; Site 1: EcoR 1;
Site 2: Not 1; The library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:191-806,
1996. Denatured RNA was size fractionated on a 1% agarcse
gel.First strand cDNA was printed with oligated with lorgy
primer containing a Not I site.Double strand cDNA was size
selected according to mRNA size fraction, ligated with BCoR
I adaptor, digested with Not I and then cloned
directionally into pXX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is CGACTGAAT. This library was created for the University
lows Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,
process.

An EcoRI adaptor was used on the S' end of the cDNA as follows: 5'-AATTCGGAGAGAAACTAGTCTGAGT(18)-3'. The library was size-selected and went through one round of amplification. Average insert size is 1.7 kb, with a range from 0.4-12 kb. Tumor identification by consensus pathology; contains chromosome 1p and 19q deletion as determined by CGH. This library was constructed by Dr. Martin Schiller (Johns Hopkins University)."
